Principle of the Assay: This assay employs a two-site sandwich ELISA to quantitate CYP2C9 in Human serum, plasma, cell culture supernates. An antibody specific for CYP2C9 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any CYP2C9 present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for CYP2C9 is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of CYP2C9 bound in the initial step. The color development is stopped and the intensity of the color is measured.

Intended Uses: For the quantitative detection of Human Cytochrome P450 2C9 (CYP2C9) concentration in serum, plasma, cell culture supernates and other biological fluids.

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
