Intended Uses: The kit is a sandwich enzyme immunoassay for in vitro quantitative measurement of IFN γ in rabbit serum, plasma, tissue homogenates, cell lysates, cell culture supernates and other biological fluids.

Principle of the Assay: The microplate provided in this kit has been pre-coated with an antibody specific to IFN γ . Standards or samples are then added to the appropriate microplate wells with a biotin-conjugated antibody specific to IFN γ . Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB substrate solution is added, only those wells that contain IFN γ , biotin-conjugated antibody and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the addition of sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm $\pm$ 10nm. The concentration of IFN γ in the samples is then determined by comparing the O.D. of the samples to the standard curve.
