ADDITIONAL INFORMATION

Related Product Information for anti-PYGL antibody

This gene encodes a homodimeric protein that catalyses the cleavage of alpha-1, 4-glucosidic bonds to release glucose-1-phosphate from liver glycogen stores. This protein switches from inactive phosphorylase B to active phosphorylase A by phosphorylation of serine residue 15. Activity of this enzyme is further regulated by multiple allosteric effectors and hormonal controls. Humans have three glycogen phosphorylase genes that encode distinct isozymes that are primarily expressed in liver, brain and muscle, respectively.
