Related Product Information for anti-LMAN1 antibody

This is a rabbit polyclonal antibody against LMAN1. It was validated on Western Blot using a cell lysate as a positive control.

Target Description: LMAN1 is a type I integral membrane protein localized in the intermediate region between the endoplasmic reticulum and the Golgi, presumably recycling between the two compartments. The protein is a mannose-specific lectin and is a member of a novel family of plant lectin homologs in the secretory pathway of animal cells. Mutations in its gene are associated with a coagulation defect. Using positional cloning, its gene was identified as the disease gene leading to combined factor V-factor VIII deficiency, a rare, autosomal recessive disorder in which both coagulation factors V and VIII are diminished.The protein encoded by this gene is a type I integral membrane protein localized in the intermediate region between the endoplasmic reticulum and the Golgi, presumably recycling between the two compartments.
