Biological Significance	Carboxypeptidase N is a plasma metallo-protease that cleaves basic amino acids from the C terminal of peptides and proteins. The enzyme is important in the regulation of peptides like kinins and anaphylatoxins, and has also been known as kininase-1 and anaphylatoxin inactivator. This enzyme is a tetramer comprised of two identical regulatory subunits and two identical catalytic subunits; this gene encodes the catalytic subunit. Mutations in this gene can be associated with angioedema or chronic urticaria resulting from carboxypeptidase N deficiency.
Cross-Reactivity	Human, Mouse, Rat
Immunogen	Carboxypeptidase N1 antibody was raised using the middle region of CPN1 corresponding to a region with amino acids FQKLAKVYSYAHGWMFQGWNCGDYFPDGTNGASWYSLSKGMQDFNYLHT
Preparation and Storage	Store at 2-8 degree C for short periods. For longer periods of storage, store at -20 degree C. Avoid repeat freeze-thaw cycles.
