Biological Significance	Ankyrins are a family of proteins that are believed to link the integral membrane proteins to the underlying spectrin-actin cytoskeleton and play key roles in activities such as cell motility, activation, proliferation, contact and the maintenance of specialized membrane domains. Ankyrin 1, the prototype of this family, was first discovered in the erythrocytes, but since has also been found in brain and muscles. Mutations in erythrocytic ankyrin 1 have been associated in approximately half of all patients with hereditary spherocytosis. Complex patterns of alternative splicing in the regulatory domain, giving rise to different isoforms of ankyrin 1 have been described, however, the precise functions of the various isoforms are not known.
Cross-Reactivity	Human, Mouse, Rat, Dog
Immunogen	Ankyrin 1 antibody was raised using the C terminal of ANK1 corresponding to a region with amino acids VVRQIDLSSADAAQEHEEVELRGSLQPDLEGRKGAQIVKRASLKRKQ
Preparation and Storage	Store at 2-8 degree C for short periods. For longer periods of storage, store at -20 degree C. Avoid repeat freeze-thaw cycles.

IHC (Immunohistochemistry)

Ankyrin 1 antibody was used for immunohistochemistry at a concentration of 4-8 ug/ml to stain Alveolar cells (arrows) in Human Lung. Magnification is at 400X

WB (Western Blot)

Ankyrin 1 antibody (AAA224460) used at 1.25 ug/ml to detect target protein.
