Background/Introduction: Neutral Protease is frequently used as a secondary enzyme in conjunction with collagenase and/or other proteases in many primary cell isolation and tissue dissociation applications. Neutral Protease dissociates fibroblast-like cells more efficiently than epithelial-like cells so it has also been used for differential isolation and culture applications. Other advantages are its non-mammalian (bacterial) source and its ability to be inhibited by EDTA. The assay is initiated with the enzymatic catalysis of casein by NP in neutral environment. The enzyme catalysed reaction products can be measured at a colorimetric readout at 660 nm.
