Principle of the Assay: The Human Orosomuroid 1 ELISA (Enzyme-Linked Immunosorbent Assay) kit is an in vitro enzyme-linked immunosorbent assay for the quantitative measurement of Human Orosomuroid 1 in Cell Culture Supernates, Serum, Plasma. This assay employs an antibody specific for Human Orosomuroid 1 coated on a 96-well plate. Standards and samples are pipetted into the wells and Orosomuroid 1 present in a sample is bound to the wells by the immobilized antibody. The wells are washed and biotinylated anti-Human Orosomuroid 1 antibody is added. After washing away unbound biotinylated antibody, HRP-conjugated streptavidin is pipetted to the wells. The wells are again washed, a TMB substrate solution is added to the wells and color develops in proportion to the amount of Orosomuroid 1 bound. The Stop Solution changes the color from blue to yellow, and the intensity of the color is measured at 450 nm.

Background: Alpha-1-acid glycoprotein, or orosomuroid, is a relatively abundant plasma protein synthesized in the liver. It has a molecular weight of 40,000 Da and is a single polypeptide chain of about 180 amino acids. AGP is considered an acute phase reactant; its plasma levels increase several fold during acute infections. It belongs to the lipocalin family and binds numerous basic and neutral lipophilic drugs and steroid hormones. And this gene is located in 9q34.3-qter.
