ADDITIONAL INFORMATION

Related Product Information for MAN2A1 elisa kit	Principle of the Assay: MAN2A ELISA kit applies the competitive enzyme immunoassay technique utilizing a polyclonal anti-MAN2A antibody and an MAN2A-HRP conjugate. The assay sample and buffer are incubated together with MAN2A-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the MAN2A concentration since MAN2A from samples and MAN2A-HRP conjugate compete for the anti-MAN2A antibody binding site. Since the number of sites is limited, as more sites are occupied by MAN2A from the sample, fewer sites are left to bind MAN2A-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The MAN2A concentration in each sample is interpolated from this standard curve. Intended Uses: This MAN2A ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Human MAN2A. This ELISA kit for research use only, not for therapeutic or diagnostic applications!
