ADDITIONAL INFORMATION

Related Product Information for MDC elisa kit	Background: The kit is a sandwich enzyme immunoassay for in vitro quantitative measurement of MDC in mouse serum, plasma, cell culture supernatants, tissue homogenates and other biological fluids. Principle of the Assay: This assay employs the quantitative sandwich enzyme immunoassay technique. An antibody specific for mouse MDC has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any MDC present is bound by the immobilized antibody. After washing away any unbound substances, and then a detection antibody specific for MDC is added to the wells and binds to the combination of capture antibody MDC in sample. Following a wash to remove any unbound combination, and enzyme conjugate is added to the wells. Following incubation and wash steps, a substrate solution is added to the wells and color develops in proportion to the amount of MDC bound in the initial step. The color development is stopped and the absorbance is measured.
