ADDITIONAL INFORMATION

Related Product Information for EFNB2 elisa kit	Principle of the Assay: This assay employs the quantitative sandwich enzyme immunoassay technique. An antibody specific for EFNB2 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any EFNB2 present is bound by the immobilized antibody. Following incubation unbound samples are removed during a wash step, and then a detection antibody specific for EFNB2 is added to the wells and binds to the combination of capture antibody-EFNB2 in sample. Following a wash to remove any unbound combination, and enzyme conjugate is added to the wells. Following incubation and wash steps, a substrate is added. A colored product TMB is formed in proportion to the amount of EFNB2 present in the sample. The reaction is terminated by addition of acid and absorbance is measured. A standard curve is prepared from seven EFNB2 standard dilutions and EFNB2 sample concentration determined. Background/Introduction: The kit is a sandwich enzyme immunoassay for in vitro quantitative measurement of EFNB2 in human tissue homogenates, cell lysates, cell culture supernates and other biological fluids.
