

Human IL-10 ELISA Kit | IL-10 elisa kit

Human IL-10 ELISA Kit (High Sensitivity)

CATALOG #
AAA282158

REACTIVITY
Human

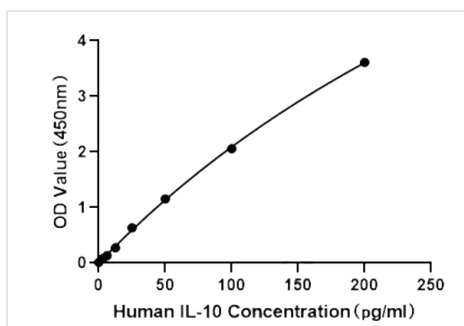

PRODUCT SYNONYMS

IL-10; Human IL-10 ELISA Kit (High Sensitivity); IL-10 elisa kit

PRODUCT SPECIFICATIONS

Reactivity	Human
Specificity	This assay recognizes both recombinant and natural human IL-10. The factors listed below were prepared at 50ng/mL and assayed for cross-reactivity. No significant cross-reactivity was observed. Note: Limited by current skills and knowledge, it is impossible for us to complete the cross- reactivity detection between IL-10 and all the analogues, therefore, cross reaction may still exist.
Assay Type	Quantitative Sandwich
Sensitivity	< 0.63pg/mL
Intra-assay Precision	Intra-plate Precision 3 samples with low, middle and high level IL-10 were tested 16 times on one plate, respectively. Intra-Assay: CV<10%
Inter-assay Precision	Inter-plate Precision 3 samples with low, middle and high level IL-10 were tested on 3 different plates, 8 replicates in each plate. Inter-Assay: CV<15%
Preparation and Storage	Store unopened kit at 2-8 degree C for 1 week. If more than one week, please keep the components of the kit according to the instructions. Do not use past kit expiration date.

ADDITIONAL INFORMATION

Related Product Information for IL-10 elisa kit	Background: The kit is a sandwich enzyme immunoassay for in vitro quantitative measurement of IL-10 in human serum, plasma and cell culture supernatants. Principle of the Assay: This assay employs the quantitative sandwich enzyme immunoassay technique. An antibody specific for human IL-10 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any IL-10 present is bound by the immobilized antibody. After washing away any unbound substances, and then a detection antibody specific for IL-10 is added to the wells and binds to the combination of capture antibody IL-10 in sample. Following a wash to remove any unbound combination, and enzyme conjugate is added to the wells. Following incubation and wash steps, a substrate solution is added to the wells and color develops in proportion to the amount of IL-10 bound in the initial step. The color development is stopped and the absorbance is measured.
