Principle of the Assay: Human A proliferation inducing ligand (APRIL) ELISA Kit employs a two-site sandwich ELISA to quantitate APRIL in samples. An antibody specific for Human APRIL has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any APRIL present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated APRIL detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of APRIL bound in the initial step. The color development is stopped and the intensity of the color is measured.
