Principle of the Assay: Human Actin, Alpha Cardiac Muscle 1 (ACTC1) ELISA Kit employs a two-site sandwich ELISA to quantitate ACTC1 in samples. An antibody specific for ACTC1 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any ACTC1 present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated Human ACTC1 detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of ACTC1 bound in the initial step. The color development is stopped and the intensity of the color is measured.

Background/Introduction: Actins are highly conserved proteins that are involved in various types of cell motility. Polymerization of globular actin (G-actin) leads to a structural filament (F-actin) in the form of a two-stranded helix. Each actin can bind to four others. The protein encoded by this gene belongs to the actin family which is comprised of three main groups of actin isoforms, alpha, beta, and gamma. The alpha actins are found in muscle tissues and are a major constituent of the contractile apparatus. Defects in this gene have been associated with idiopathic dilated cardiomyopathy (IDC) and familial hypertrophic cardiomyopathy (FHC).
