Principle of the Assay: Human Pepsinogen A (PG-A) ELISA Kit employs a two-site sandwich ELISA to quantitate PG-A in samples. An antibody specific for Human PG-A has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any PG-A present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated PG-A detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of PG-A bound in the initial step. The color development is stopped and the intensity of the color is measured.
