Principle of the Assay: Human Myosin-VIIa (MYO7A) ELISA Kit employs a two-site sandwich ELISA to quantitate MYO7A in samples. An antibody specific for Human MYO7A has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any MYO7A present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated MYO7A detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of MYO7A bound in the initial step. The color development is stopped and the intensity of the color is measured.
