Principle of the Assay: Mouse Transforming Growth Factor alpha (TGF-alpha) ELISA Kit employs a two-site sandwich ELISA to quantitate TGF-alpha in samples. An antibody specific for Mouse TGF-alpha has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any TGF-alpha present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated TGF-alpha detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of TGF-alpha bound in the initial step. The color development is stopped and the intensity of the color is measured.
