ADDITIONAL INFORMATION

Related Product Information for IL-23 elisa kit	Principle of the Assay: Interleukin 23 (IL-23) is a heterodimeric cytokine that is related to IL-12. It is composed of two disulfide-linked subunits, a p19 subunit that is unique to IL-23, and a p40 subunit that is shared with IL-12. The p19 subunit has homology to the p35 subunit of IL-12, as well as to other single chain cytokines such as IL-6 and IL-11. Human IL-23 ELISA Kit employs a double antibody sandwich method to quantitate Human IL-23 in samples. An antibody specific for Human IL-23 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Human IL-23 present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for Human IL-23 is added to the wells. After washing, proprietary Streptavidin-HRP conjugates is added to the wells. Following a wash to remove any unbound streptavidin-enzyme reagent, adding HRP Substrate (TMB), TMB turns blue under the catalysis of HRP, and turns yellow after adding stop solution. Measure the OD value with a microplate reader at 450nm wavelength. The IL-23 concentration is proportional to the OD450 nm value.
