Intended Uses: This mouse prolactin antigen assay is intended for the quantitative determination of prolactin antigen in mouse plasma.

Principle of the Assay: Mouse prolactin will bind to the affinity purified capture antibody coated on the microtiter plate. After appropriate washing steps, biotinylated anti-mouse prolactin primary antibody binds to the captured protein. Excess primary antibody is washed away and bound antibody, which is proportional to the total prolactin present in the samples, is reacted with peroxidase-conjugated streptavidin. Following an additional washing step, TMB substrate is used for color development which is measured at 450nm. A standard calibration curve is prepared along with the samples to be measured using dilutions of mouse prolactin. Color development is proportional to the concentration of prolactin in the samples.

Background: Mouse prolactin (PRL) is a 197 aa, 23kD peptide hormone [1] that is secreted primarily by the pituitary gland in both males and females, though its major roles are in pregnancy and lactation [2,3]. Prolactin may have a role in breast cancer development, with higher prolactin levels correlating with postmenopausal breast cancer risk [4].
