Quinidine is a class I antiarrhythmic agent. Like all other class I antiarrhythmic agents, quinidine primarily works by blocking the fast inward sodium current (I_{Na}) which causes the phase 0 depolarization of the cardiac action potential to decrease (decreased V_{max}). Quinidine also blocks the slowly inactivating, tetrodotoxin-sensitive Na current, the slow inward calcium current (I_{Ca}), the rapid (I_{Kr}) and slow (I_{Ks}) components of the delayed potassium rectifier current, the inward potassium rectifier current (I_{K1}), the ATP-sensitive potassium channel (I_{KATP}) and I_{to}. At micromolar concentrations, quinidine inhibits Na⁺/K⁺-ATPase by binding to the same receptor sites as the digitalis glycosides such as ouabain.

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
