Principle of the Assay: This assay employs a two-site sandwich ELISA to quantitate IL1B in Horse serum, plasma. An antibody specific for IL1B has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any IL1B present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for IL1B is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of IL1B bound in the initial step. The color development is stopped and the intensity of the color is measured.

Intended Uses: For the quantitative detection of Horse Interleukin-1 beta (IL1B) concentration in serum, plasma and other biological fluids.
