ADDITIONAL INFORMATION

Related Product Information for LEP elisa kit	Principle of the Assay: This assay employs a two-site sandwich ELISA to quantitate LEP in samples. An antibody specific for LEP has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and anyLEP present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for LEP is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of LEP bound in the initial step. The color development is stopped and the intensity of the color is measured.
