Principle of the Assay: This assay employs a two-site sandwich ELISA to quantitate C3a in samples. An antibody specific for C3a has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any C3a present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for C3a is added to the wells. After washing, Streptavidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of C3a bound in the initial step. The color development is stopped and the intensity of the color is measured.

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
