ADDITIONAL INFORMATION

Related Product Information for SMYD3 recombinant protein	Description: Recombinant full-length human SMYD3 was expressed by baculovirus in Sf9 insect cells using an N-terminal GST tag. Scientific Background: SMYD3 (SET and MYND domain containing 3) is a histone methyltransferase that plays a role in transcriptional regulation as a member of an RNA polymerase complex. The introduction of SMYD3 enhanced cell growth and the histone methyltransferase activity of SMYD3 involved in the proliferation of cancer cells (1). A variable number of tandem repeat polymorphism in an E2F-1 binding element in the 5-prime flanking region of SMYD3 is a risk factor for human cancers (2).
