Biological Significance	Salmonella is a genus of rod-shaped, Gram-negative, non-spore-forming, predominantly motile enterobacteria with diameters around 0.7 to 1.5 μm , lengths from 2 to 5 μm , and flagella which grade in all directions (i.e. peritrichous). They are chemorganotrophs, obtaining their energy from oxidation and reduction reactions using organic sources, and are facultative anaerobes. Most species produce hydrogen sulfide, which can readily be detected by growing them on media containing ferrous sulfate, such as TSI.
Cross Reactivity	Specific for Salmonella typhimurium via whole cell ELISA.
Preparation and Storage	Store at 4°C until ready for use.
