Related Product Information for IgM elisa kit

Principle of the Assay: The microtiter plate provided in this kit has been pre-coated with IgM. Standards or samples are then added to the appropriate microtiter plate wells with Horseradish Peroxidase (HRP) -conjugated antibody preparation specific for IgM, mix well and incubated. The more the amount of IgM in samples, the less HRP-antibody bound by pre-coated IgM. Then a TMB (3,3',5,5' tetramethyl-benzidine) substrate solution is added to each well. And the color develops in opposite to the amount of IgM in the sample. The color development is stopped and the intensity of the color is measured.
