

Mouse Insulin like Growth Factor beta1 ELISA Kit | ILGF-beta1 elisa kit

Mouse Insulin like Growth Factor beta1 ELISA Kit

CATALOG #
AAA88000

REACTIVITY
Mouse

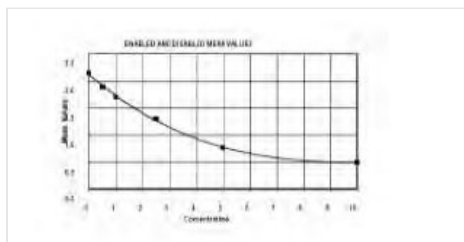

PRODUCT SYNONYMS

Insulin like Growth Factor beta1; Mouse Insulin like Growth Factor beta1 ELISA Kit; Mouse Insulin like Growth Factor b1 ELISA Kit; ILGF-beta1 elisa kit

PRODUCT SPECIFICATIONS

Reactivity	Mouse
Samples	Serum, plasma, Cell Culture Supernatants, body fluid and tissue homogenate
Assay Type	Competitive
Detection Range	50-1000pg/mL
Sensitivity	1.0pg/mL
Preparation and Storage	Store all reagents at 2-8 degree C.

ADDITIONAL INFORMATION

Related Product Information for ILGF-beta1 elisa kit	For Samples: Cell culture fluid, body fluid, tissue homogenate, serum and blood plasma Intended Uses: This PRO-IL-1BETA ELISA kit is intended for laboratory research use only. The stop solution changes the color from blue to yellow and the intensity of the color is measured at 450 nm using a spectrophotometer. In order to measure the concentration of PRO-IL-1BETA in the sample, this PRO-IL-1BETA ELISA Kit includes a set of calibration standards. The calibration standards are assayed at the same time as the samples and allow the operator to produce a standard curve of Optical Density versus PRO-IL-1BETA concentration. The concentration of in the samples is then determined by comparing the O.D. of the samples to the standard curve. Principle of the Assay: The coated well immunoenzymatic assay for the quantitative measurement of PRO-IL-1BETA utilizes a multiclonal anti-PRO-IL-1BETA antibody and an PRO-IL-1BETA-HRP conjugate. The assay sample and buffer are incubated together with PRO-IL-1BETA-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the PRO-IL-1BETA concentration since PRO-IL-1BETA from samples and PRO-IL-1BETA-HRP conjugate compete for the anti-PRO-IL-1BETA antibody binding site. Since the number of sites is limited, as more sites are occupied by PRO-IL-1BETA from the sample, fewer sites are left to bind PRO-IL-1BETA-HRP conjugate. Standards of known PRO-IL-1BETA concentrations are run concurrently with the samples being assayed and a standard curve is plotted relating the intensity of the color (Optical Density) to the concentration of PRO-IL-1BETA. The PRO-IL-1BETA concentration in each sample is interpolated from this standard curve.
Product Categories/Family for ILGF-beta1 elisa kit	Signal Transduction

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
